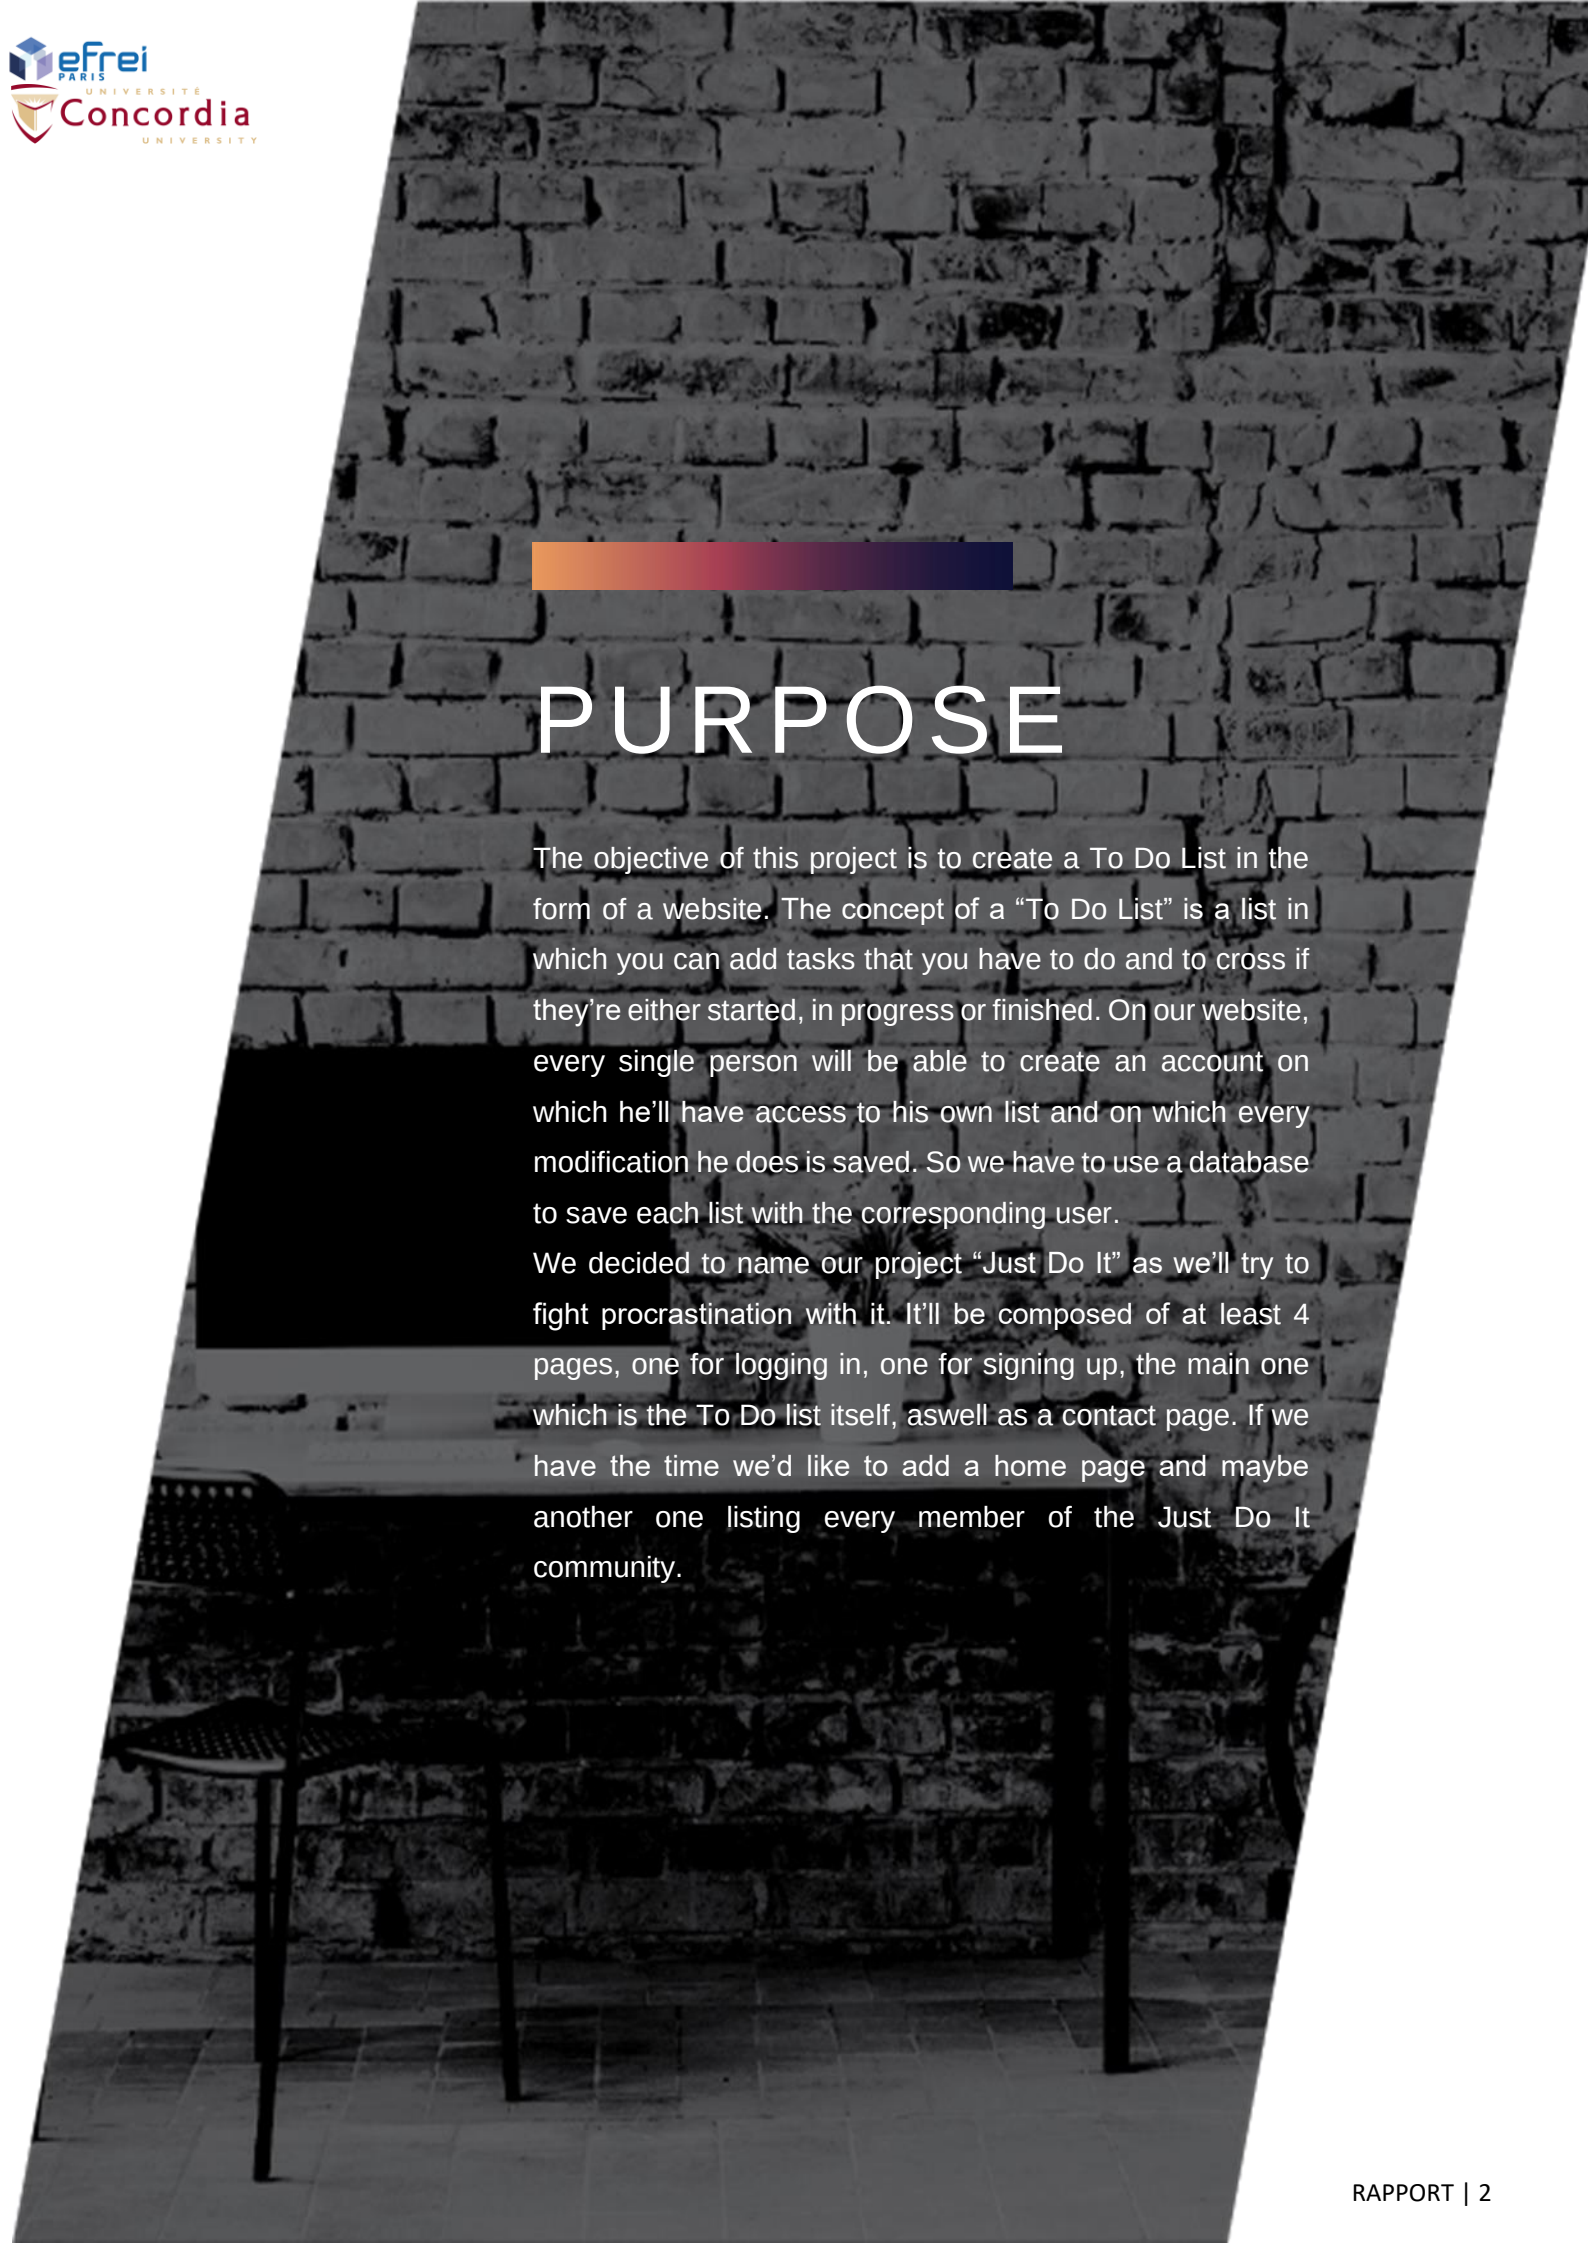
MILESTONE 3

PROJECT WEB

GRP: A | RAHAMIM SITBON
KEENAN BARANES
NOE BRUMELOT



PURPOSE

The objective of this project is to create a To Do List in the form of a website. The concept of a “To Do List” is a list in which you can add tasks that you have to do and to cross if they’re either started, in progress or finished. On our website, every single person will be able to create an account on which he’ll have access to his own list and on which every modification he does is saved. So we have to use a database to save each list with the corresponding user.

We decided to name our project “Just Do It” as we’ll try to fight procrastination with it. It’ll be composed of at least 4 pages, one for logging in, one for signing up, the main one which is the To Do list itself, aswell as a contact page. If we have the time we’d like to add a home page and maybe another one listing every member of the Just Do It community.

STRUCTURE

FRONT-END

The front end is what the user sees while using the website and the interaction he has with it, so for these parts we decided to use vue.js which is the third most popular application for front-end in term of framework in the world.

BACK-END

Node.js is a free software platform in JavaScript, suitable for network applications.

DATABASE

To create our database, we will be using the MySQL application and we are going to link it to our website. MySQL is a relational database management system. It is distributed under a dual GPL and has a proprietary license.

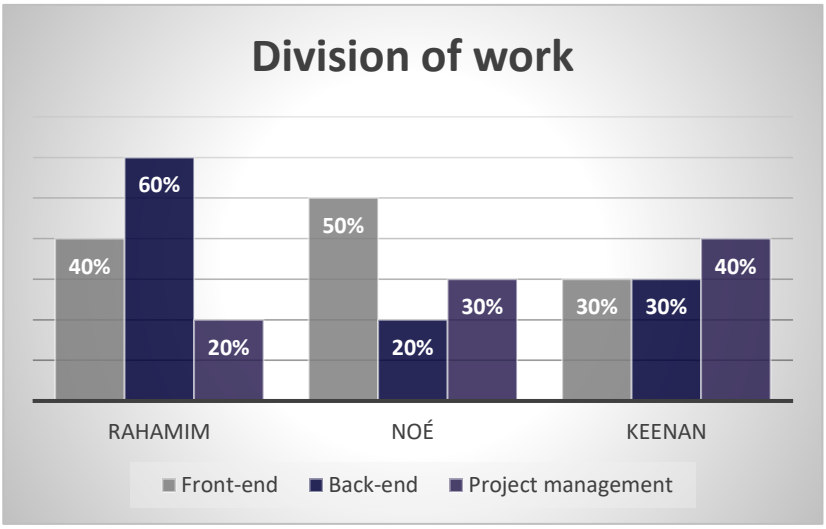
WORK DIVISION



DIAGRAMS & METHODS

METHODE USED

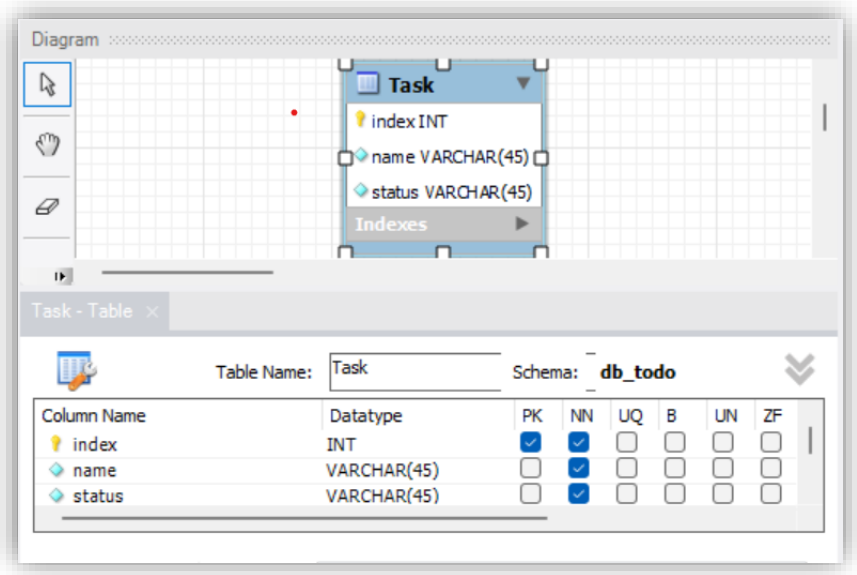
- KABAN
- SOLID
- DRY

PRIORITY

- Use modern programming practices.
- Design first, then build.

ABOUT US

- Group of 3
- 3 parts of projects



CREATE TABLE

Thanks to the UML diagram, we get that SQL code:

As a result, we can initialize our tables for the database.

```
9   -- -----------------------------------------------------
10
11  -- -----------------------------------------------------
12  -- Schema db_todo
13  -- -----------------------------------------------------
14  CREATE SCHEMA IF NOT EXISTS `db_todo` DEFAULT CHARACTER SET utf8 ;
15  USE `db_todo` ;
16
17  -- -----------------------------------------------------
18  -- Table `db_todo`.`Task`
19  -- -----------------------------------------------------
20  CREATE TABLE IF NOT EXISTS `db_todo`.`Task` (
21    `index` INT NOT NULL AUTO_INCREMENT,
22    `name` VARCHAR(45) NOT NULL,
23    `status` VARCHAR(45) NOT NULL,
24    PRIMARY KEY (`index`))
25  ENGINE = InnoDB;
26
27
28  SET SQL_MODE=@OLD_SQL_MODE;
29  SET FOREIGN_KEY_CHECKS=@OLD_FOREIGN_KEY_CHECKS;
30  SET UNIQUE_CHECKS=@OLD_UNIQUE_CHECKS;
31
```

COMMUNICATION UML DIAGRAM

A communication diagram is a UML 2.0 interaction diagram, a simplified representation of a sequence diagram focusing on message exchanges between objects

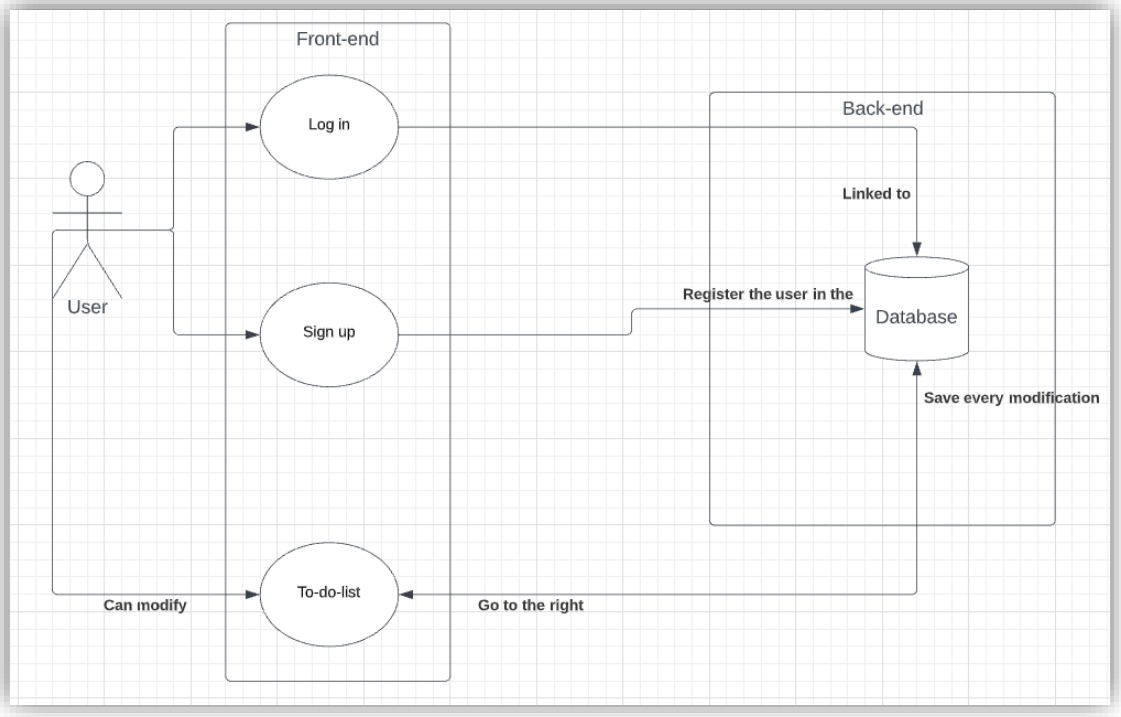


Figure 2: UML Diagram communication

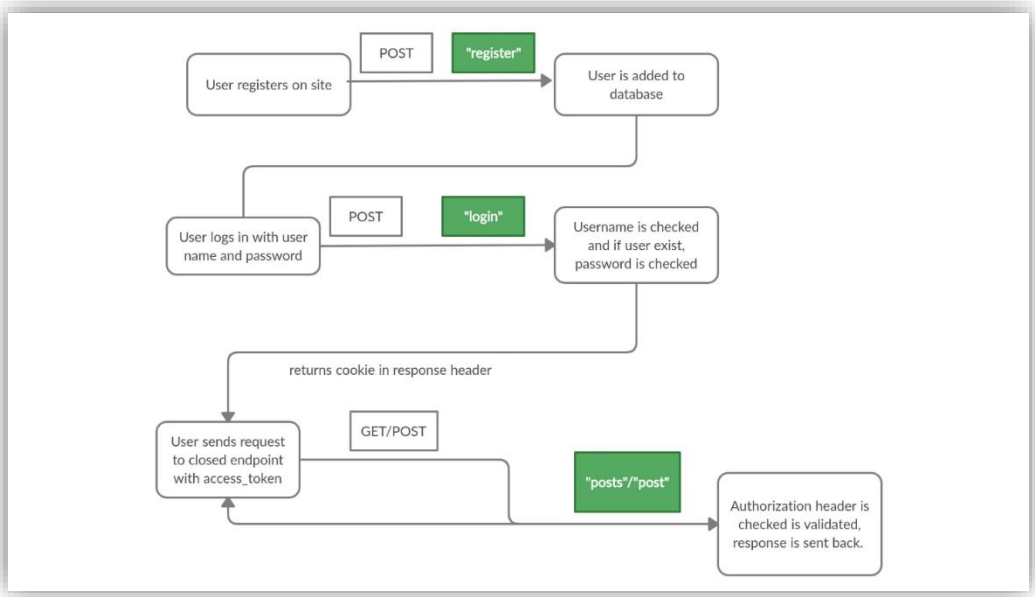
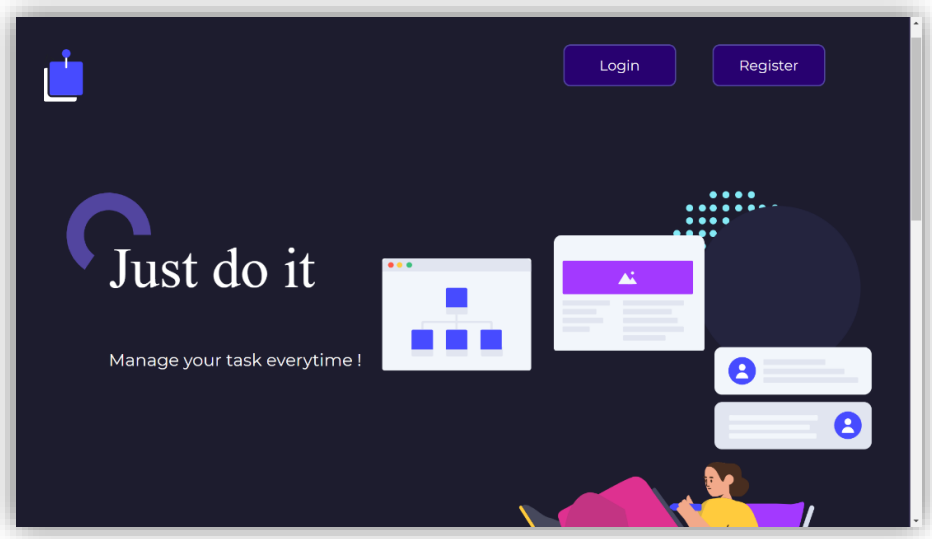
BUSINESS LAYER



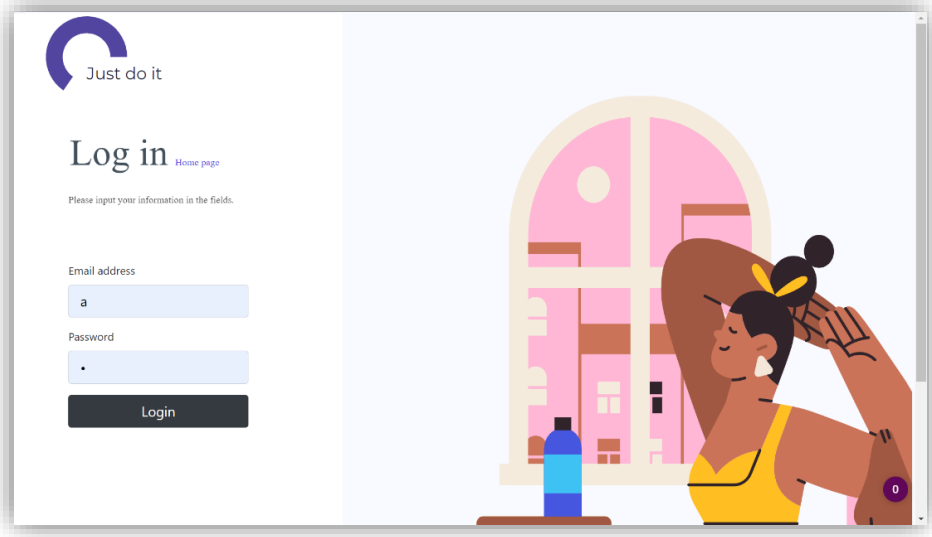
WEBSITE PAGES

Finally, we managed to have four different pages in our web site:

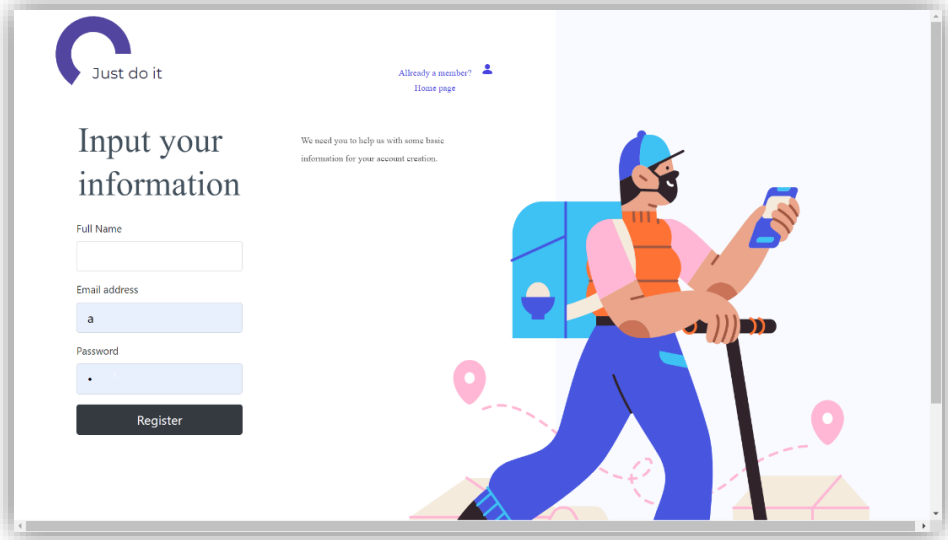
- Home page: where you can go either on login page our register page thanks to butto



- Login page: you can enter your mail address and password to access you list

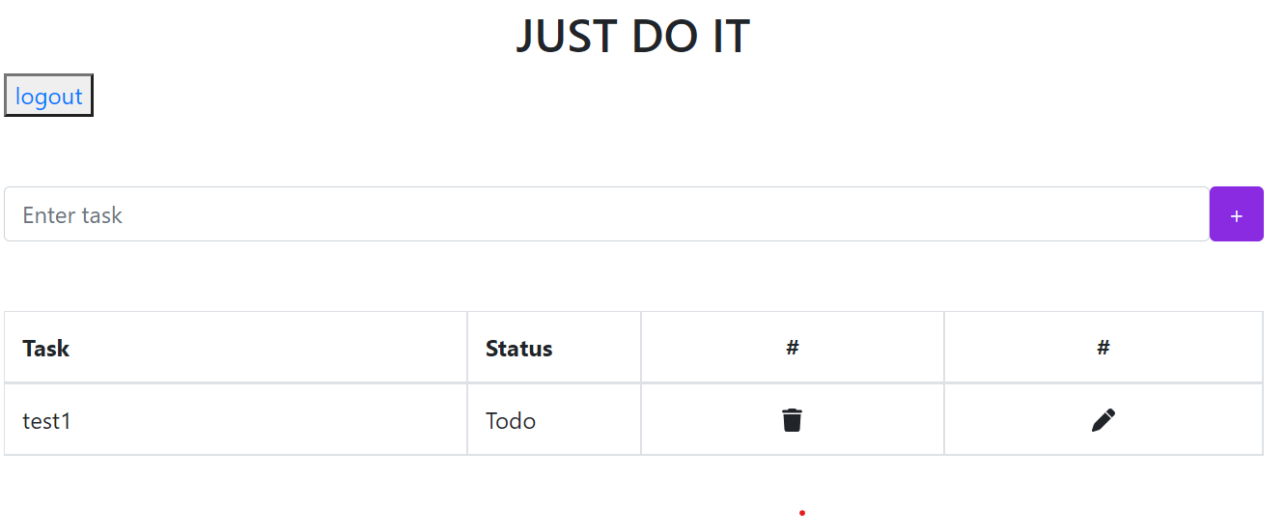


- Register page: you can create an account to have a blank list



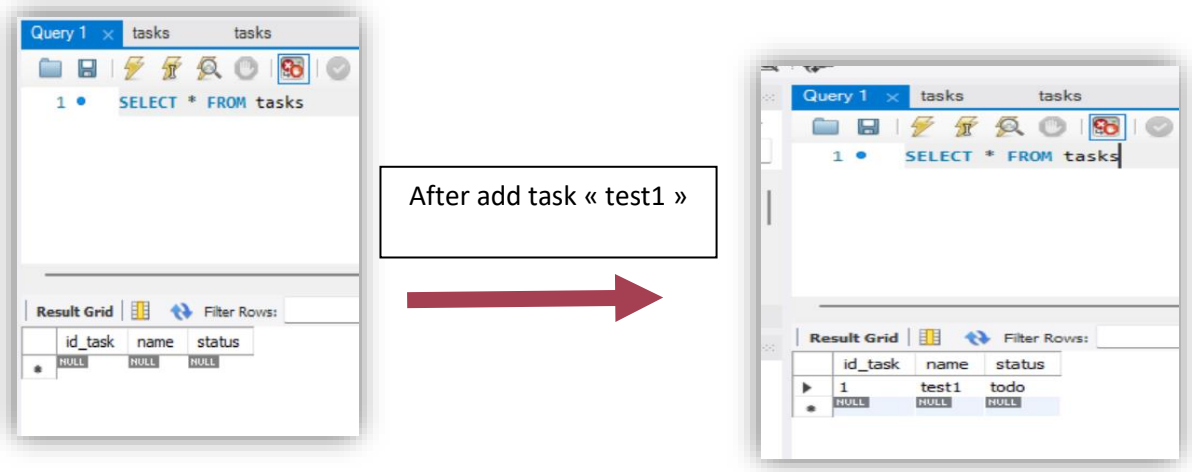
- To-do-list page: You can add and delete tasks from your list, change their status (to do or finished)

Example of a to-do-list on our web site



N O D E. J S & M y S Q L

Thanks to Node.js, we have linked our web site to a database that will get every task you add list. If you open MySQL after adding a task in your list, you will see it in your database table.



As we see in those screenshots, the task as been added successfully in the database.
To make this possible, firstly, we need to open MySQL to make the database accessible. T launch the server on the folder where we have our data for the web site thanks to “nodemon in For the client we use the command “run serve”.

P O S S I B L E I M P R O V E M E N T

We didn’t have the time to have the perfect web site as we wanted it to be. So we have som about how it could have been improved with a little bit more time. Since the database is linke To-do-list, every task added is send to the database, but we didn’t have the time to ad

function. For example when you modify the name of a task, the databse won't save it, and
same if you delete a task. As a result, we would have liked to add the modifying and deleting fu
to our program.
